
don't have table to copy from. If the second, it means you have a table with that name already which seems a bad practice to create multiple table with same name. If you want to know more, please tell me. The effect of S-adenosylmethionine on the concentration of serotonin, dopamine and their metabolites in the rat brain. The effect of the administration of S-adenosylmethionine (SAM), the precursor of the methyl donor group required for the conversion of tryptophan to 5-hydroxytryptophan (5-HTP) was studied in rats. SAM increased the concentrations of serotonin in all brain regions examined, especially in the hypothalamus and hippocampus and also increased that of homovanillic acid (HVA) and 5-HTP in the hypothalamus, hippocampus, midbrain, striatum, pons-medulla and frontal cortex. The results suggest a change in the precursors of 5-HTP in vivo and indicate that SAM is not merely a methyl donor, but may increase the formation of 5-HTP. Opinion issued December 11, 2011. In The Court of Appeals For The First District of Texas
